

This lab session covers the usage of the Wireshark application to monitor and capture the outgoing and incoming packets from a network connection (WIFI, ethernet, etc.). Specifically, students should be able to analyze HTTP, HTTPS, TCP/IP, and UDP protocols using Wireshark, a network protocol analyzer, and draw conclusions.

### Pre-lab Preparation:

1. Review the basics and the structure of HTTP, TCP/IP, and UDP protocols,
2. Install Wireshark and ensure it is running on your computer,
3. Create an online, *publically accessible* Git repository to host and upload your work in the labs. We recommend you use GitHub or GitLab.

### Lab Activities:

#### Part 1: Capturing HTTP Traffic.

##### Task 1: Start Wireshark and capture packets.

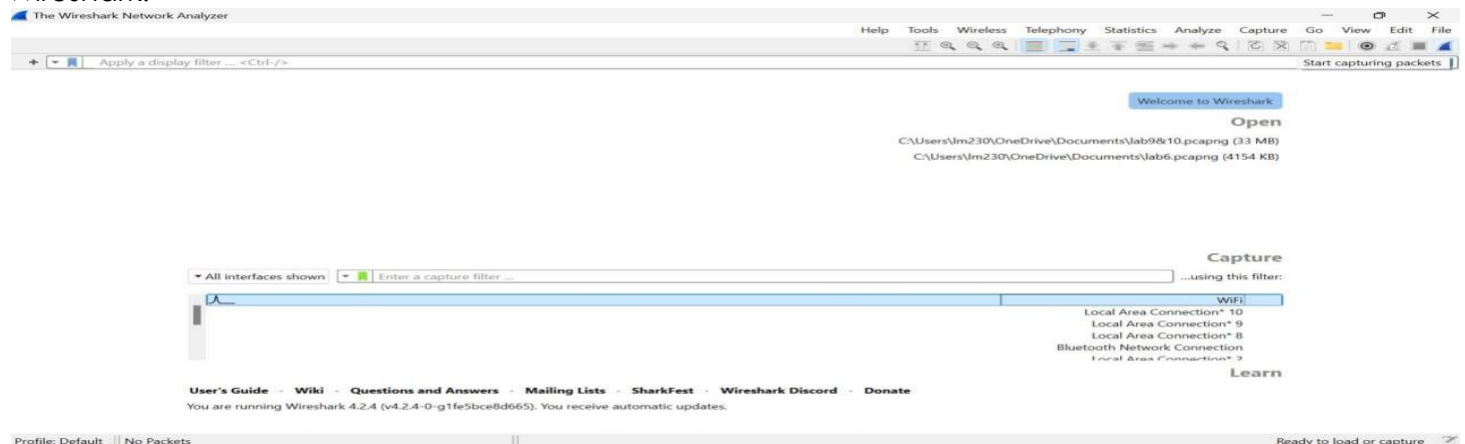

Step 1: Open Wireshark.

Step 2: Select the network interface connected to the internet (e.g., Ethernet or Wi-Fi).

Step 3: Click the "Start Capturing Packets" button (the shark fin icon).

Step 4: Open your favorite web browser and navigate to (<http://neverssl.com/>) website.

Step 5: After the website has fully loaded, stop capturing packets by clicking the red stop button in Wireshark.

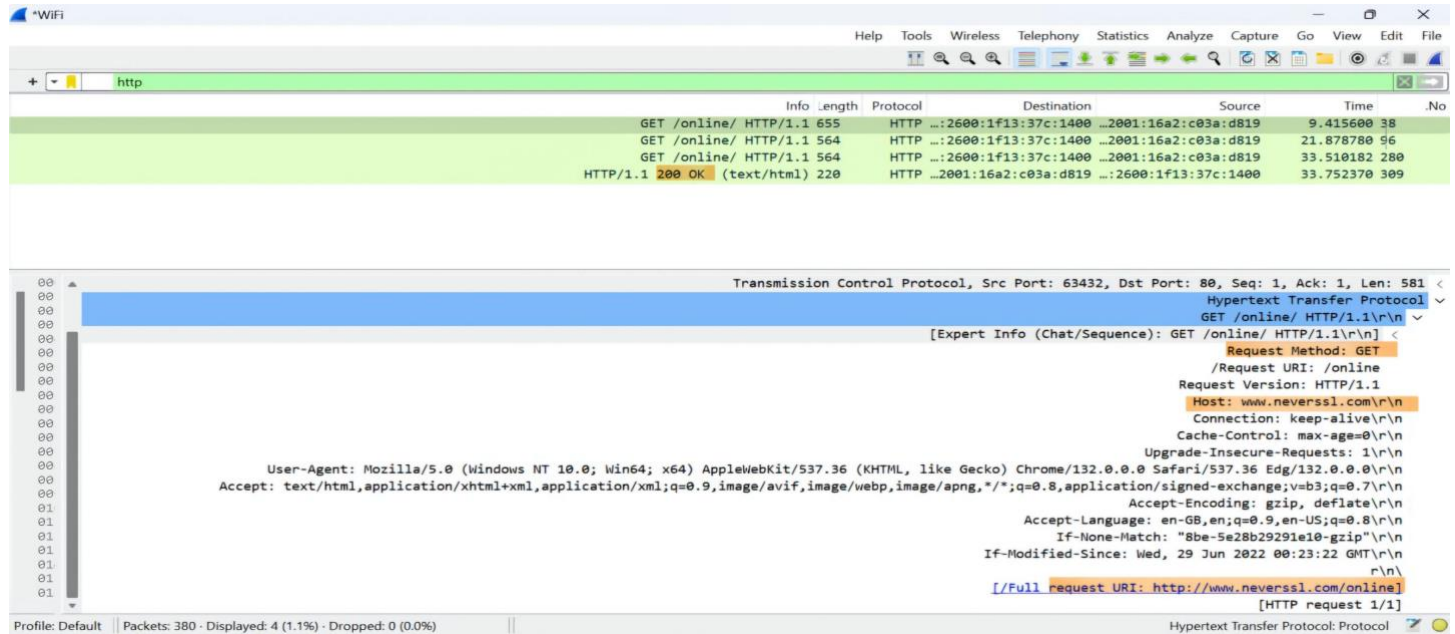

##### Task 2: Filter HTTP packets and analyze them.

Step 1: In the filter bar, type http and press Enter. This filters out only the HTTP packets from the capture.

Step 2: Select any HTTP packet to view its details.

Step 3: Observe the HTTP request and response messages. Note the method (GET, POST), URL, response codes (200 OK, 404 Not Found), etc.

**Request Method :** GET

**Request URL :** http://www.neverssl.com/online

**Response Method :** 200 OK

## Part 2: Analyzing TCP/IP Traffic.

### Task 1: Filter TCP packets

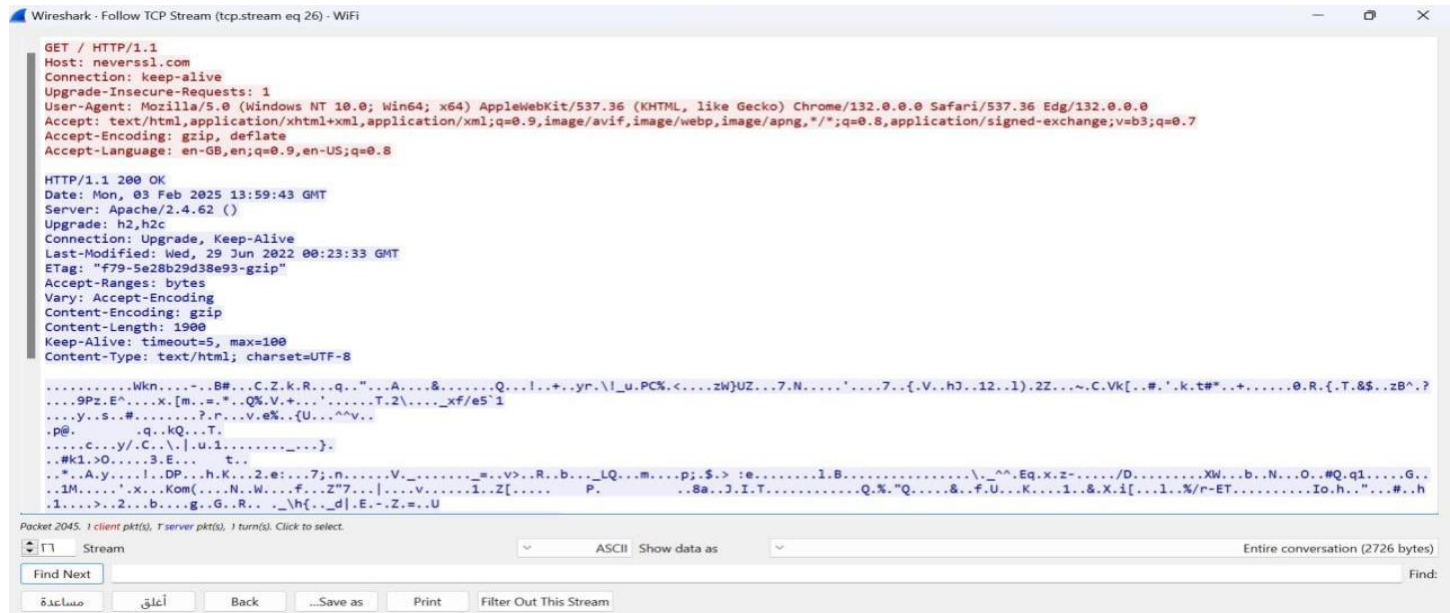

**Step 1:** Clear the previous filter and type TCP to focus on TCP packets.

**Step 2:** Select a TCP packet related to your HTTP request/response.

**Step 3:** Right-click on the packet and select "Follow" -> "TCP Stream".

**Step 4:** This shows the entire conversation between the client and server.

Wireshark - Follow TCP Stream (tcp.stream eq 26) - WiFi

```
GET / HTTP/1.1
Host: neverssl.com
Connection: keep-alive
Upgrade-Insecure-Requests: 1
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/132.0.0.0 Safari/537.36 Edg/132.0.0.0

## Task 2: Analyze TCP handshake and investigate Data Transfer and Termination

**Step 1:** Find and select packets related to the TCP three-way handshake:

- SYN: Initiates a connection.
- SYN-ACK: Acknowledges and responds to the SYN.
- ACK: Acknowledges the SYN-ACK and establishes the connection.

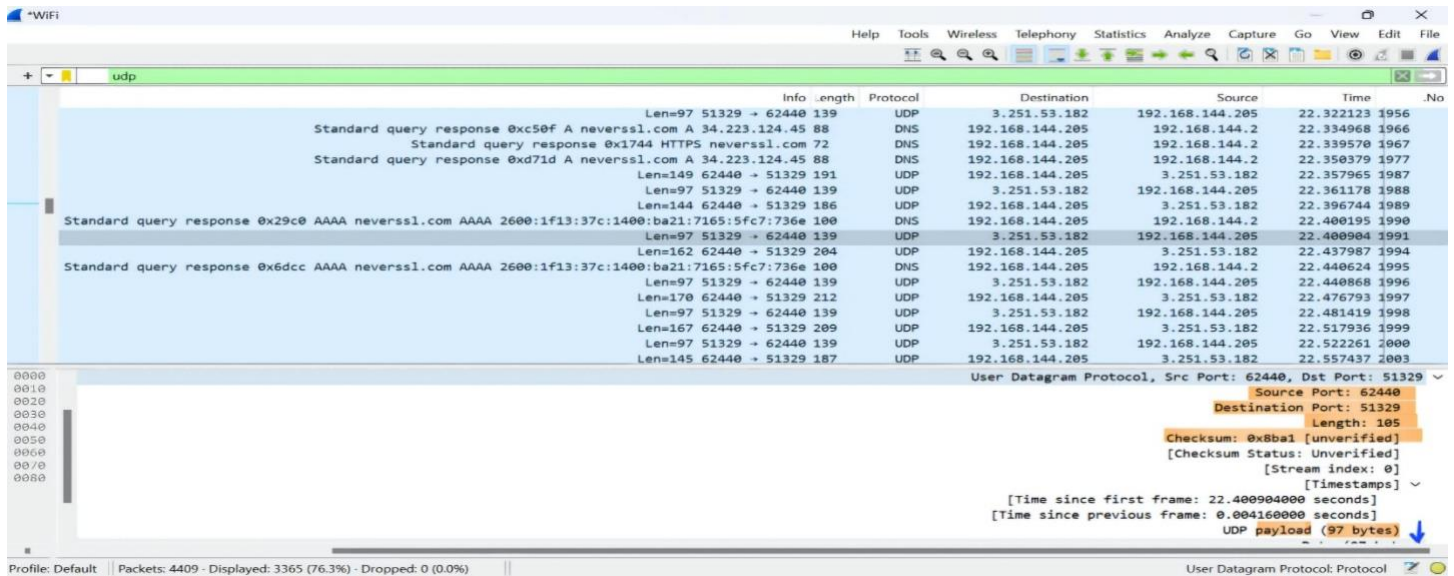

**Step 2:** Note the sequence and acknowledgment numbers. Screenshot and upload your image to your online git repository.

**Step 3:** Observe the data packets exchanged between the client and server. Take a screenshot and upload it to your online git repo.

**Step 4:** Look at the TCP termination process (FIN, ACK packets).

Data : 97 bytes.

**Step 5:** Compare the simplicity of UDP headers with TCP headers.

**TCP header (20-60 bytes):** include Source Port, Destination Port, Sequence Number, Acknowledgment Number, Header Length, Flags (Control Bits: Includes SYN, ACK, FIN, RST, PSH, and URG ), Window Size, Checksum, Urgent Pointer, and Options.

**UDP header (8 bytes):** include Source Port ,Destination Port , Length ,Checksum.

CS471 – Web Technologies (Laboratory)		Lab 1
		The Internet Protocols

**Part 4: Comparing TCP and UDP by filling in the following tables. Save your work (e.g., in an MS Word document), and upload it to your online git repo.**

**Task 1: Fill in the following table and provide reasons.**

	TCP or UDP	Reasons
Reliability and Connection Establishment	TCP	TCP is connection-oriented and establishes a connection using a three-way handshake (SYN, SYN-ACK, ACK) before data transfer. It ensures data delivery and retransmits lost packets.
Data Integrity and Ordering	TCP	TCP ensures data integrity with a checksum and maintains the correct order of packets using sequence numbers. It also uses acknowledgments (ACKs) to confirm packet delivery.

**Task 2: Identify the use Cases and Performance of TCP and UDP.**

	TCP	UDP
Use cases	<ul style="list-style-type: none"> <li>- Web Browsing (HTTP/HTTPS)</li> <li>- Email Services (SMTP, IMAP, POP3)</li> <li>- File Transfers (FTP, SFTP)</li> <li>- Remote Access (SSH, Telnet)</li> <li>- Database Communication (MySQL, PostgreSQL)</li> </ul>	<ul style="list-style-type: none"> <li>- Streaming Media (YouTube, Netflix)</li> <li>- Online Gaming (low-latency multiplayer)</li> <li>- Voice and Video Calls (VoIP, Zoom, Skype)</li> <li>- DNS Lookups</li> <li>- IOT Communication (sensors, smart devices)</li> </ul>
Performance	<ul style="list-style-type: none"> <li>- Reliable but slower due to connection setup (3-way handshake)</li> <li>- Ensures data integrity and packet ordering</li> <li>- Supports error correction and retransmission</li> <li>- Higher network overhead due to control mechanisms</li> </ul>	<ul style="list-style-type: none"> <li>- Faster, low latency due to no connection setup</li> <li>- No error correction or packet ordering (packets may arrive out of order)</li> <li>- Ideal for real-time communication</li> <li>- Lower network overhead and efficient bandwidth usage</li> </ul>
